The JRC inside the European Commission

JRC is **Who are we and what do we do?** the European Commission's in-house science service. It provides the science for policy decisions, with a view to ensuring that the EU achieves its Europe 2020 goals for a productive economy as well as a safe, secure and sustainable future.
⇒ **JRC undertakes 'direct' research related to EU policies**

The JRC plays a key role in the European Research Area and reinforces its multi-disciplinarity by networking extensively with leading scientific organisations in the Member States, Associated Countries and worldwide.

⇒ **JRC wants/needs 'indirect' research with partners to:**

- ⇒ **Access/participate in scientific excellence**
- ⇒ **Involvement/stimulation for its scientists**

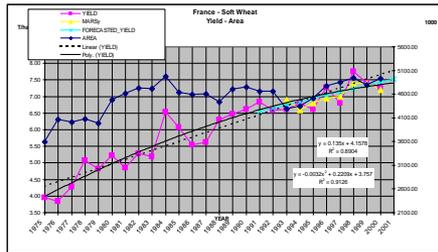

FACCE Core theme 1: Food Security, modelling

Crop yield forecasting

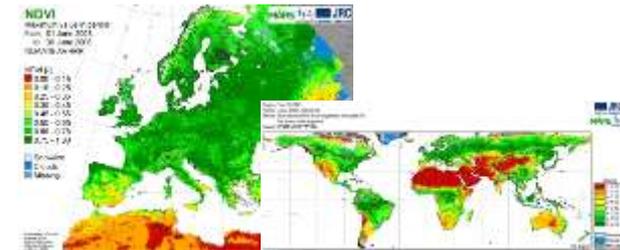

The systems are made by remote sensing, meteorological data, agro-meteorological modeling and statistical analysis tools.

Statistical infrastructure

time series regression,
similarity analyses

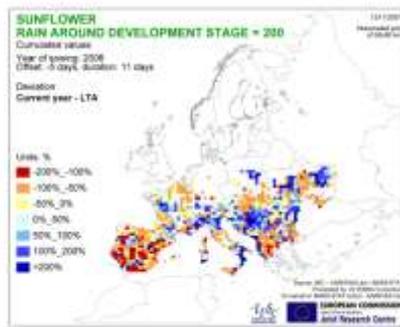

Remote Sensing infrastructure

Vegetation state & meteo indicator
since 1981 Europe, 1998 worldwide

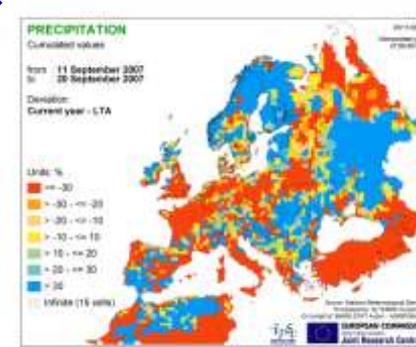

Yield forecasts
Crop assessment

Crop Model infrastructure

Agrometeo indicators derived
from crop growth model –
WOFOST / LINGRA / WARM and GWSI

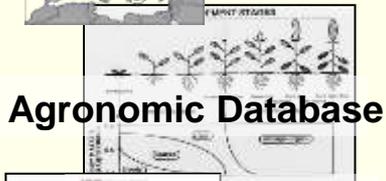

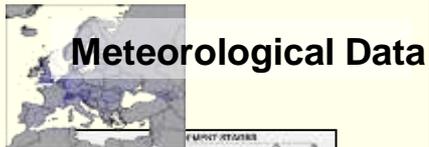

Meteorological infrastructure

observed data since 1975 Europe
under construction for Africa
worldwide ECMWF data + archive

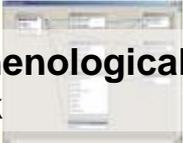

Crop assessment and yield forecasting process

Data collection & retrieval

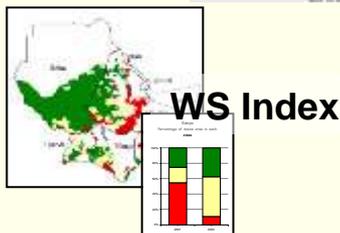

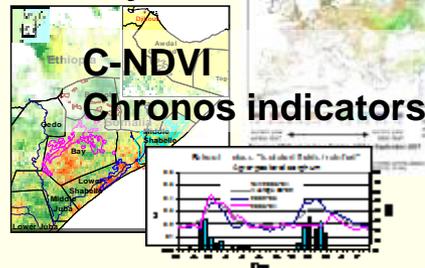

**WEB Information
Media Monitor
Magazines**

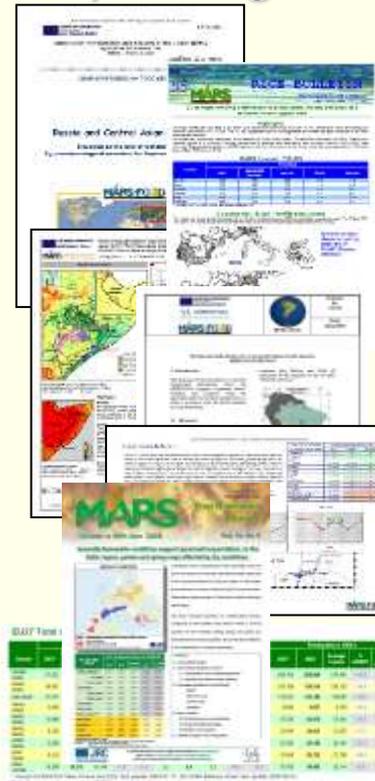

**Agro-phenological
network**

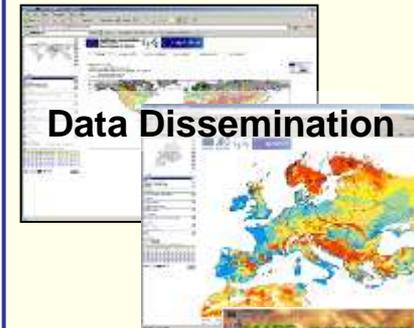

Processing & Analysis

Reporting

Dissemination

DG AGRI
DG RELEX family
DG EUROSTAT
EU Delegations
Member States
National Agencies
Int. Institutions (FAO, ...)

Final users just need some figures and very simple sketches displaying areas of concern

EU27 Total cereals yield forecasts – 22nd July 2008

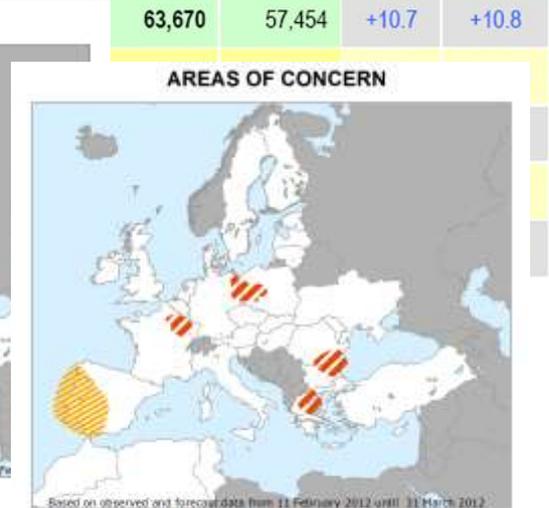

| Cereals | Area x 1000 ha | | | | | Yield t/ha | | | | | Production x 1000 t. | | | | |
|-----------------|----------------|---------------|-----------------|-----------|----------------|------------|---------------------|-----------------|-----------|----------------|----------------------|----------------|-----------------|-----------|----------------|

Data source: MARS crop yield forecasting system: 29.03.2012

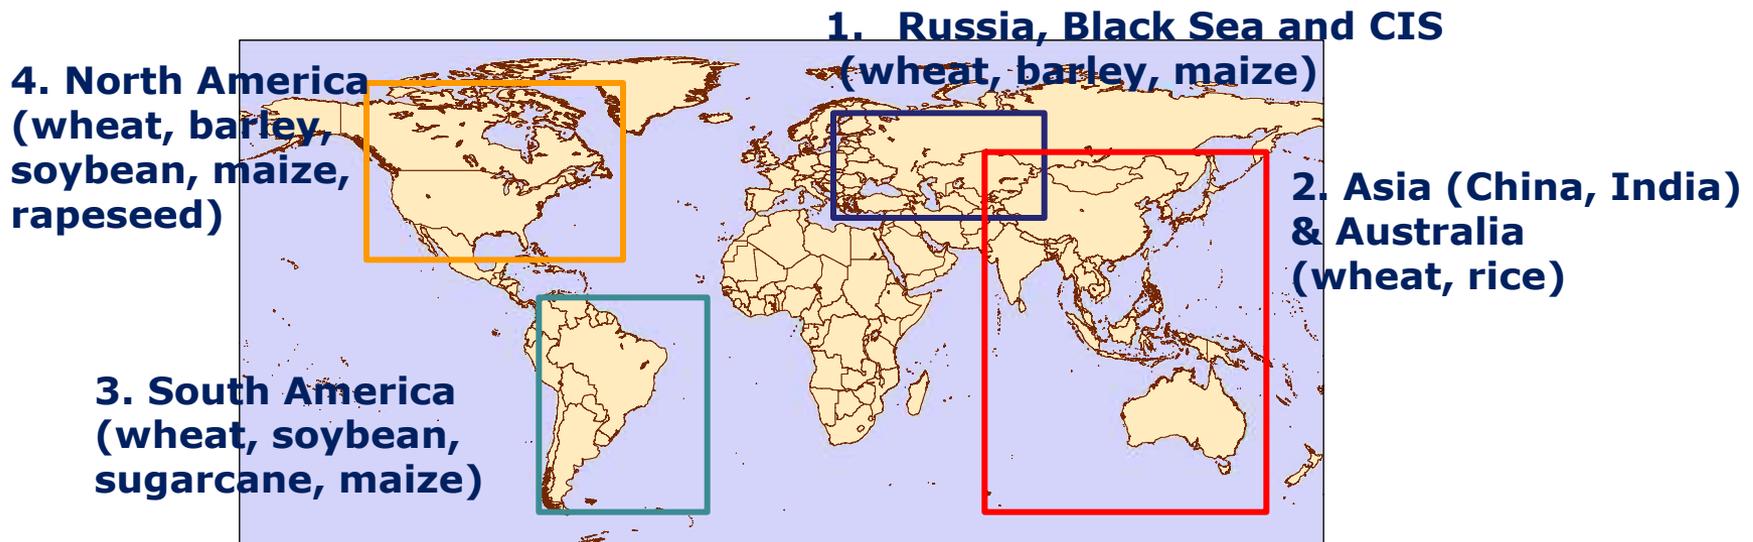

GLOBCAST – Global crop monitoring system

General objectives of GLOBCAST

- Monitor the impact of weather in main grain producing areas
- Produce short-term forecasts

4 Zones of the world

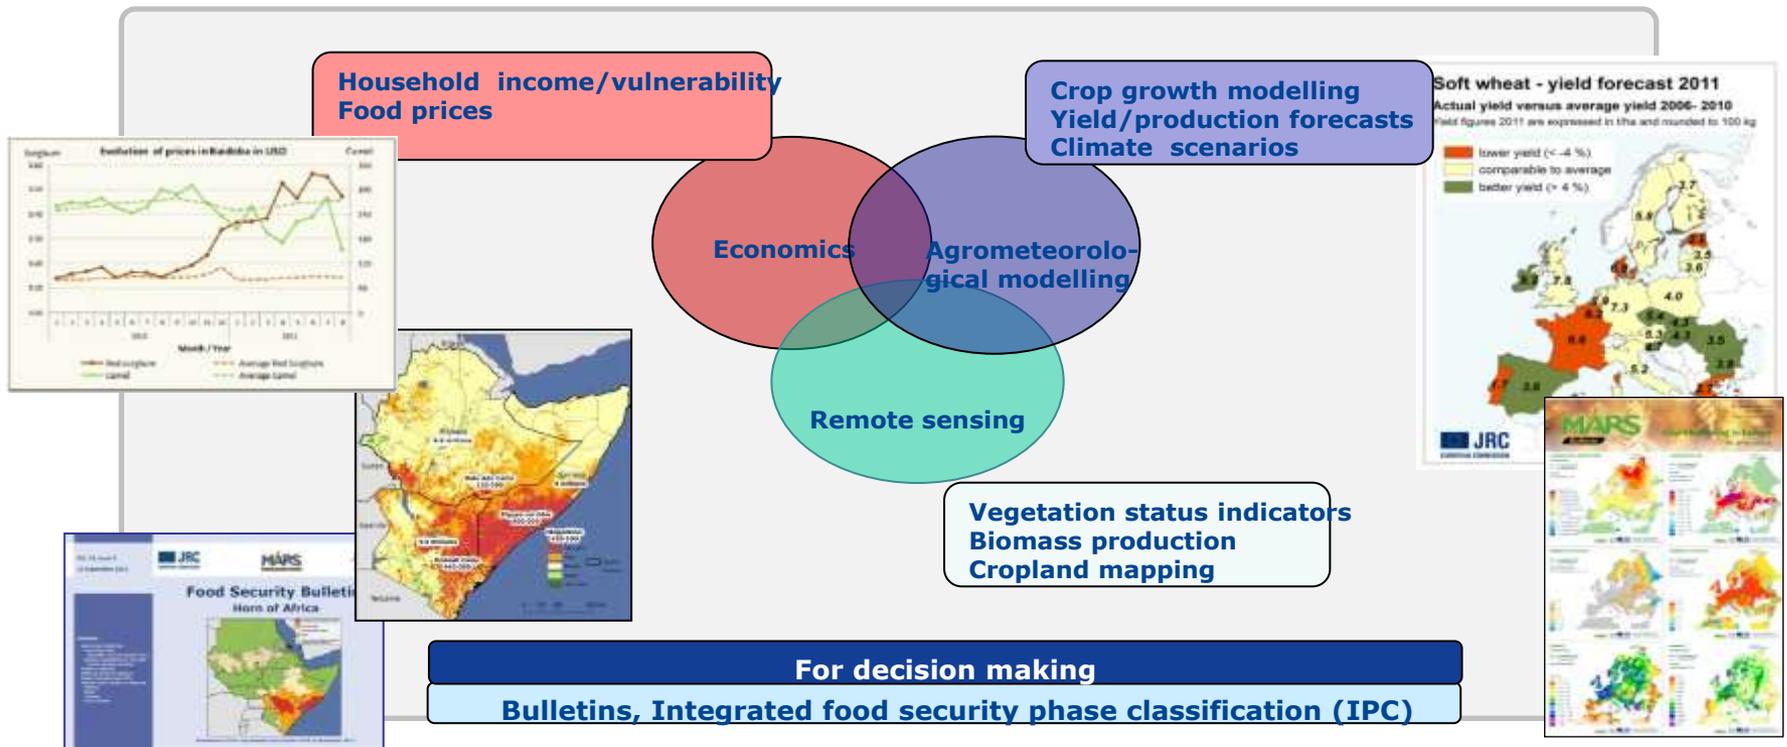

The challenge of food security

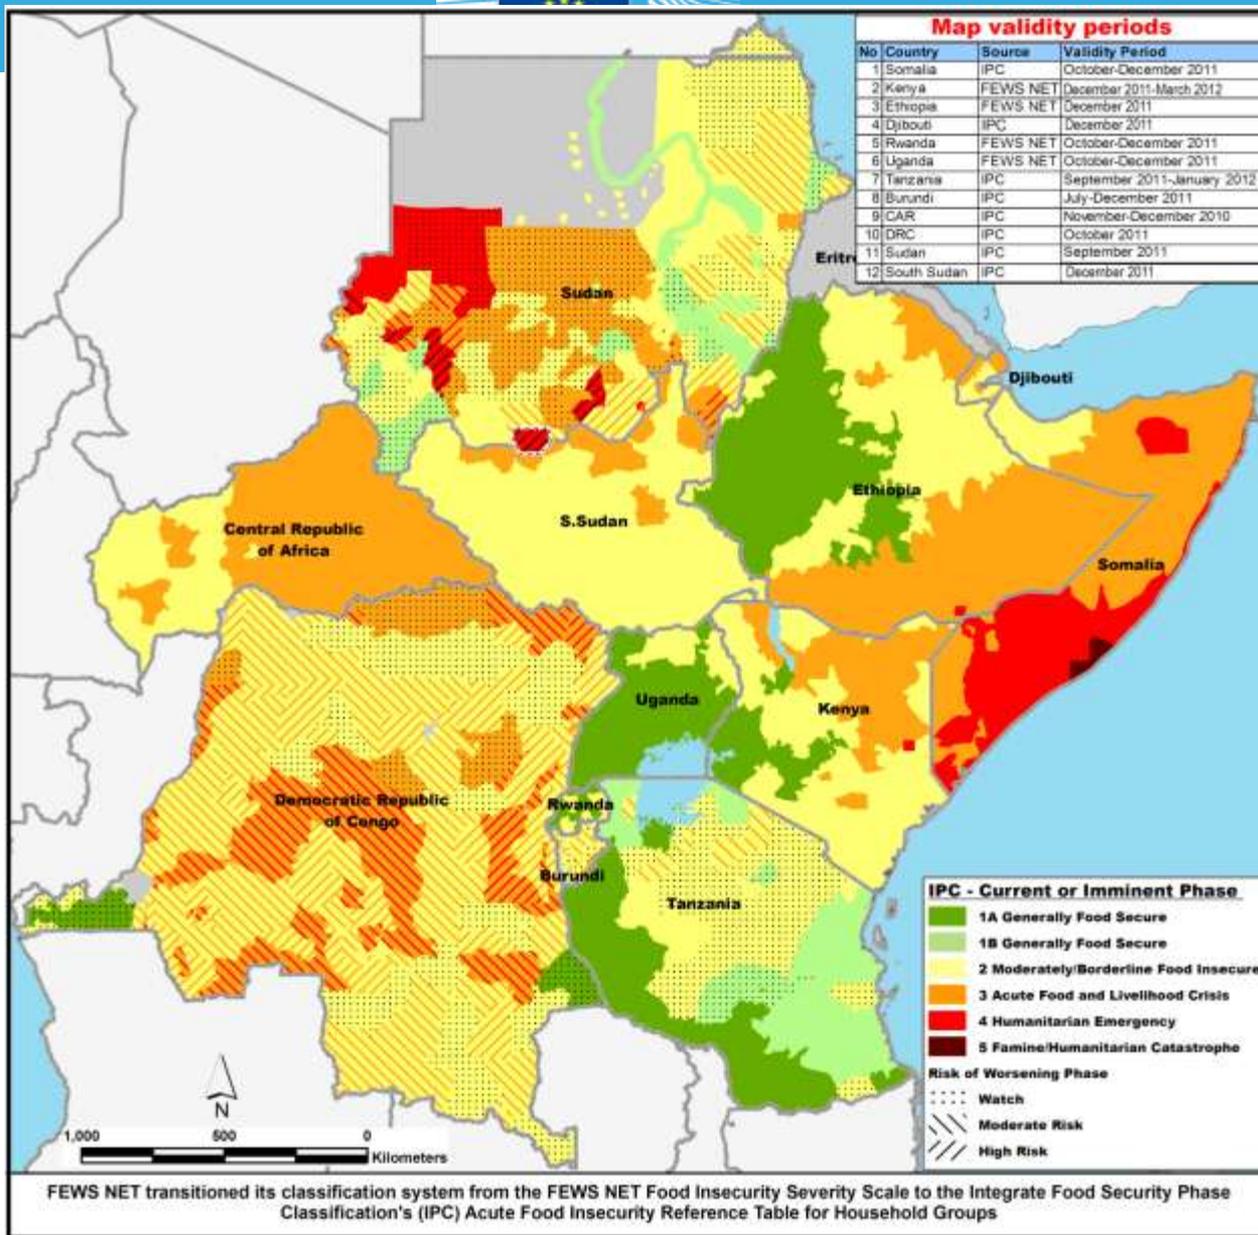

(the approach from current MARS activities.....)

Multidisciplinary approach to food security: availability, access [and utilization]

Somalia and Sudan remain in emergency food security situation despite general improvement in most parts of the region

Sources: IPC country teams; FEWS NET for Ethiopia, Kenya, Uganda and Rwanda.
 The names and boundaries on this map do not imply official endorsement or acceptance by the UN.

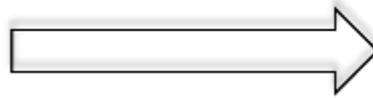

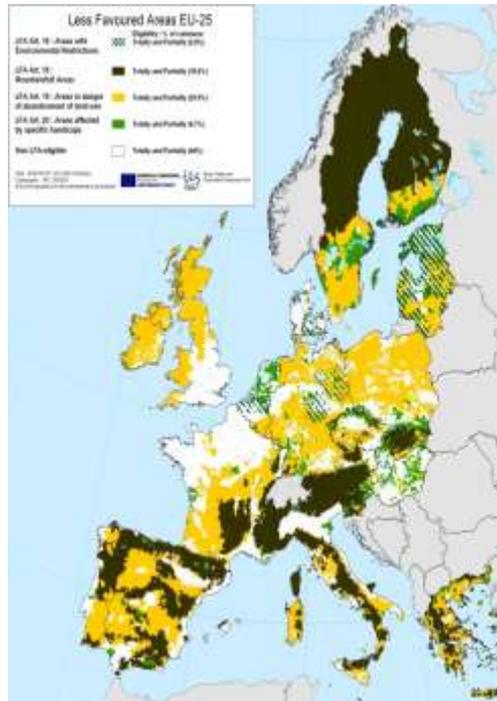

FACCE Core theme 3: Trade-offs, food, biodiversity, ecosystems

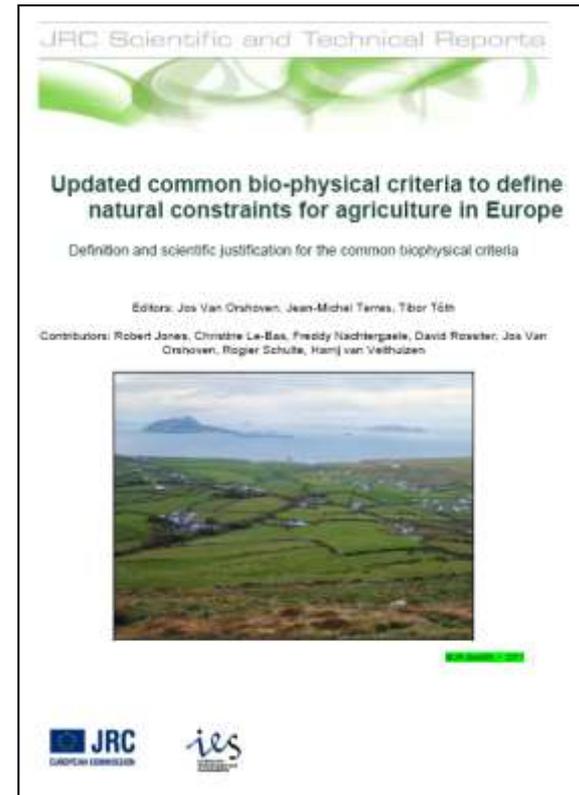

Characterisation of rural landscape

Redefinition of "Less Favoured Areas" to "Areas of Natural Constraints"

JRC technical coordination with Member States for DG Agri and DG Env

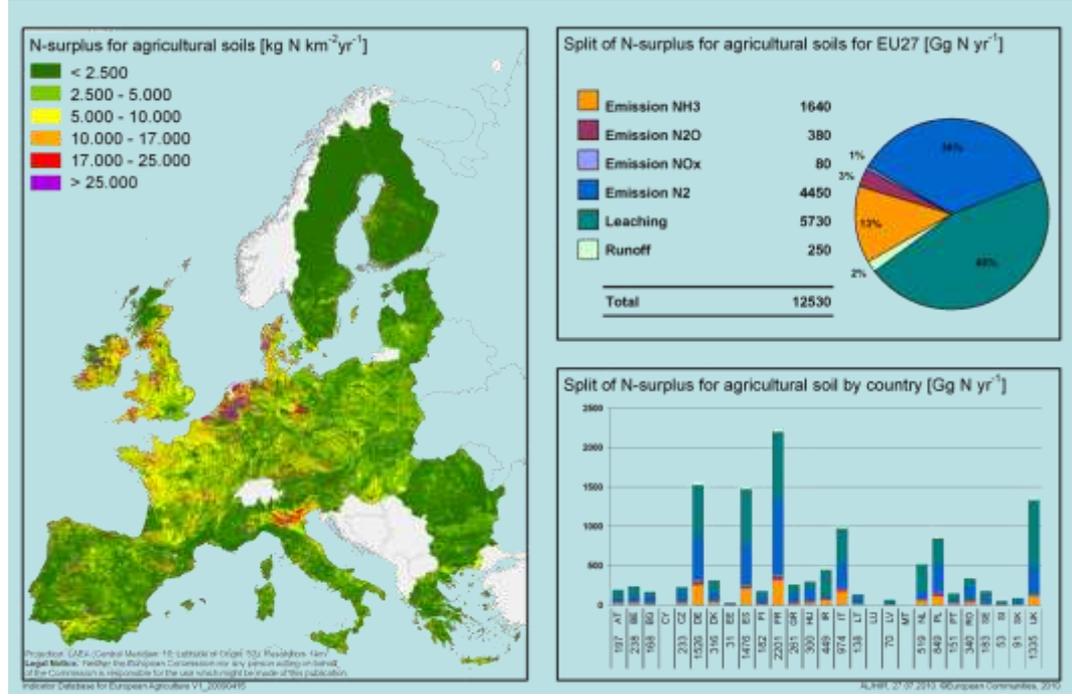

'Areas of Natural constraints' basis for possible top up payments over the flat rate of the new CAP

→ prevent land abandonment

European Nitrogen Assessment – Key maps

An evidence published this week indicates that every attempt to reduce agricultural nitrogen in the European Union (EU) has failed. It is the first time that an economic reduction has been placed on the front page by nitrogen pollution, including carbon dioxide, methane and hydrocarbons. To produce more protein, livestock must eat more than double the total nitrogen fertiliser compared to other European farm systems. This economic failure is just one of the many challenges that the European Commission, which has been in charge since 2002, is facing. It is the first time that an economic reduction has been placed on the front page by nitrogen pollution, including carbon dioxide, methane and hydrocarbons. To produce more protein, livestock must eat more than double the total nitrogen fertiliser compared to other European farm systems. This economic failure is just one of the many challenges that the European Commission, which has been in charge since 2002, is facing.

First continental-wide comprehensive assessment of nitrogen processes – flows – impacts – solutions

Sutton, M. A, Oenema, O., Erismann, J.W., Leip, A., van Grinsven, H., Winiwarter, W., 2011. Too much of a good thing. *Nature*. 472, 159-61. doi:10.1038/472159a.

Low Carbon farming ...

By: developing a tool to be used on FARM level:

An easy to use carbon calculator, to be used by farmers or the farming associations.

For: DG ENV and the European Parliament

Project in progress:

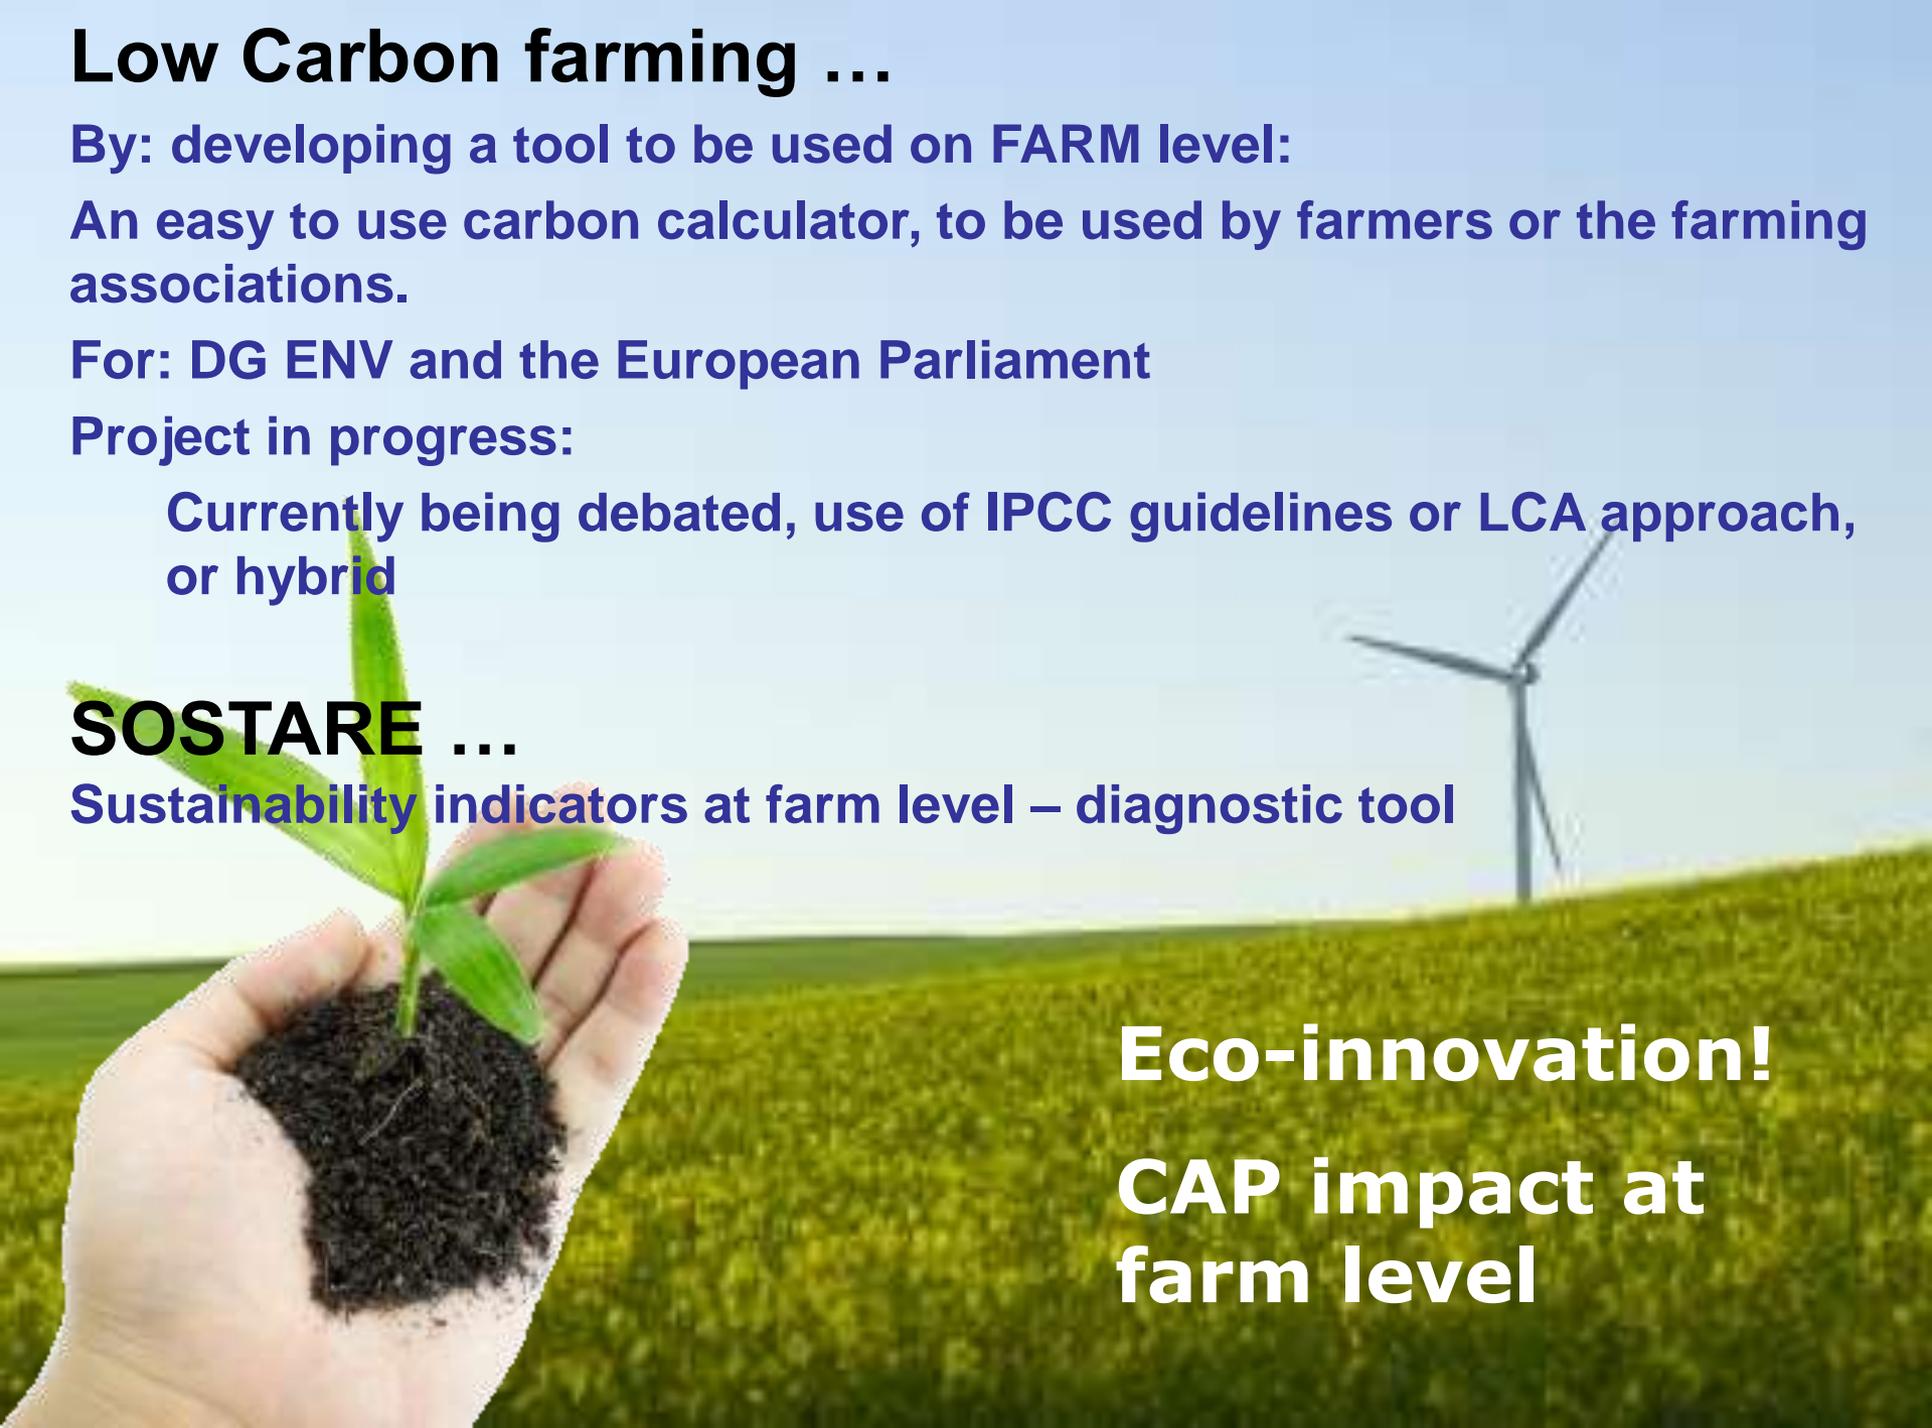

Currently being debated, use of IPCC guidelines or LCA approach, or hybrid

SOSTARE ...

Sustainability indicators at farm level – diagnostic tool

Eco-innovation!

**CAP impact at
farm level**

What's for the future?

Detailed characterization of rural landscapes (Managed through Land Parcel System LPIS)

(Study done by Ekotoxa, CZ)

Landscape features (location, type)

- Hedgerow
- Group of trees
- Isolated trees
- Pond
- Ancient monument
- ...

Land use / land cover

- Arable land
- pasture
- Forest
- Permanent crop
- ...

Eligibility of land

100% eligible

Exhaustive characterisation of Rural Areas ?

LPIS + Satellite imagery + additional GIS layers (Digital Elevation Model, ...)

Location of: Parcels in vulnerable zones, rivers and green cover buffer, features

Land use layer

- Water bodies
- Permanent pasture
- Forest
- Urban areas

LPIS layer

Irrigation systems layer

Road network

Natura 2000 zones

River network

Nitrate vulnerable zones

Digital Elevation Model

3D view of rural landscape

+ Collection of IACS data: history of farmers declarations

Provide relevant **information** to farmers (digital, paper)

Increase awareness on Cross Compliance (**Advice:** FAS)

Reduce risk of infringements

→ Sound **management of rural areas (LPIS as cornerstone)**

FACCE Core theme 4: Adaptation to climate change

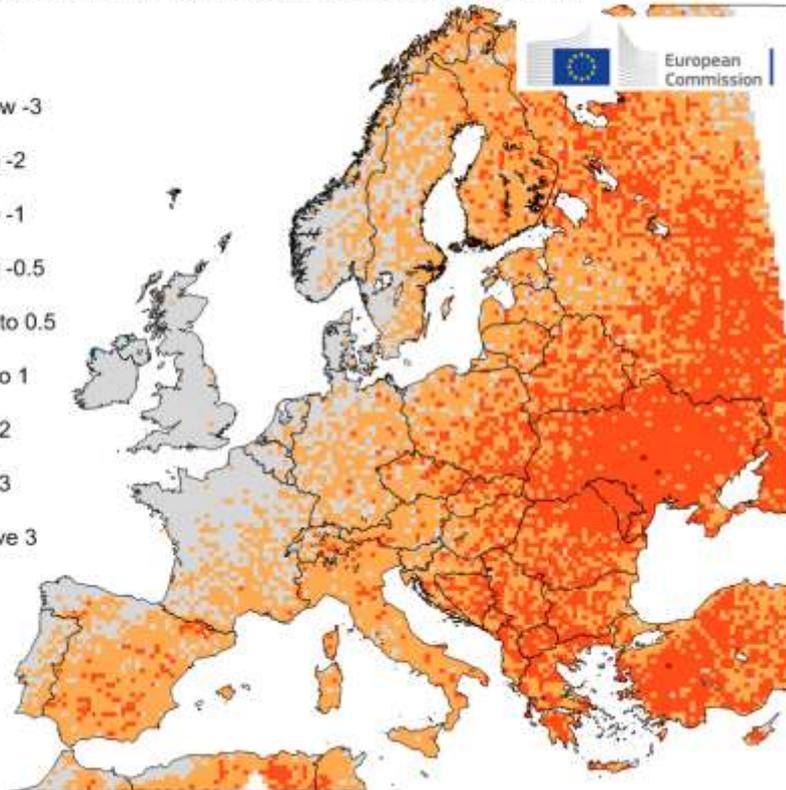

Temperature: COLD vs WARM A1B

Differences of monthly averaged maximum air temperature
A1B scenario, ECHAM5, April-September, 2030-2000 (baseline)

Units: °C

- Below -3
- 3 to -2
- 2 to -1
- 1 to -0.5
- 0.5 to 0.5
- 0.5 to 1
- 1 to 2
- 2 to 3
- Above 3

Wheat water-limited yield

Percent difference of water-limited yield for wheat
A1B scenario, ECHAM5, 2030-2000 (baseline)

Units: %

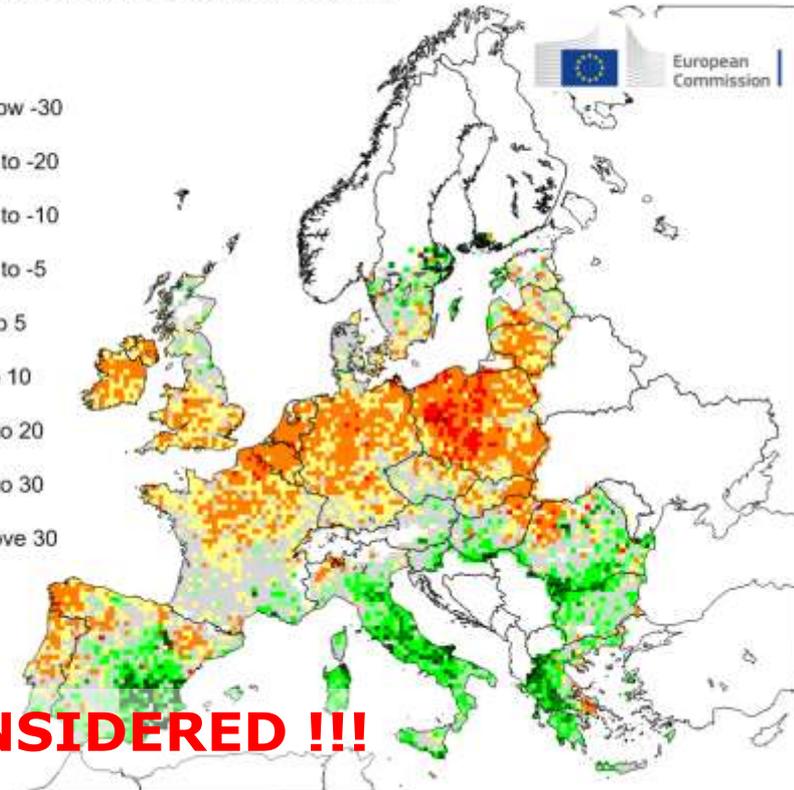

- Below -30
- 30 to -20
- 20 to -10
- 10 to -5
- 5 to 5
- 5 to 10
- 10 to 20
- 20 to 30
- Above 30

Percent difference of water-limited yield for wheat
A1B scenario, HadCM3, 2030-2000 (baseline)

Units: %

- Below -30
- 30 to -20
- 20 to -10
- 10 to -5
- 5 to 5
- 5 to 10
- 10 to 20
- 20 to 30
- Above 30

NO ADAPTATION CONSIDERED !!!

Adaptation strategies

The adaptation strategies evaluated are examples of technical adaptation that farmer could implement autonomously;

The adaptation strategies tested group under three main aspects:

- Use of different varieties and hybrids;
- Changing planting time;
- Allowing for a larger use of irrigation water (maize only).

Given the time frame of the analysis, a conservative choice was made with respect to possible choices of varieties to be tested, which have not included new, improved varieties.

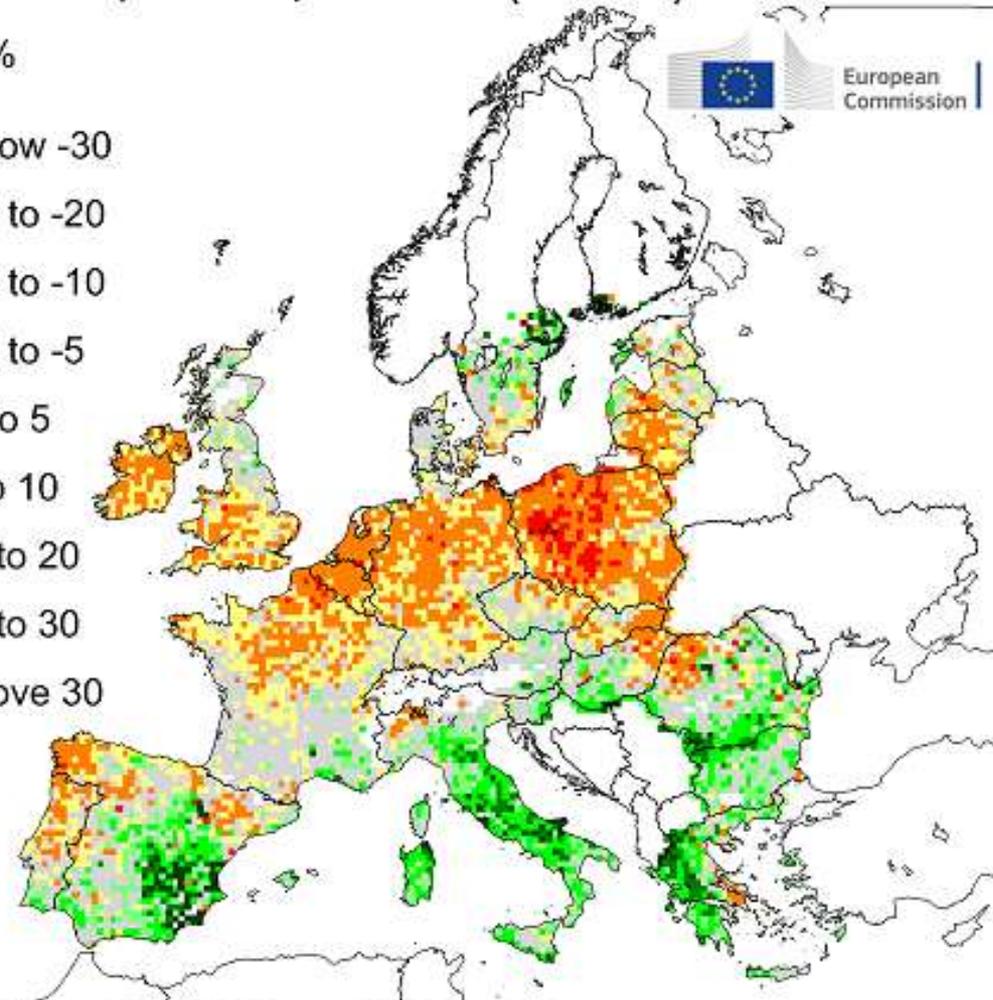

Wheat – water limited, no adaptation

Percent difference of water-limited yield for wheat
A1B scenario, HadCM3, 2030-2000 (baseline)

Units: %

- Below -30
- -30 to -20
- -20 to -10
- -10 to -5
- -5 to 5
- 5 to 10
- 10 to 20
- 20 to 30
- Above 30

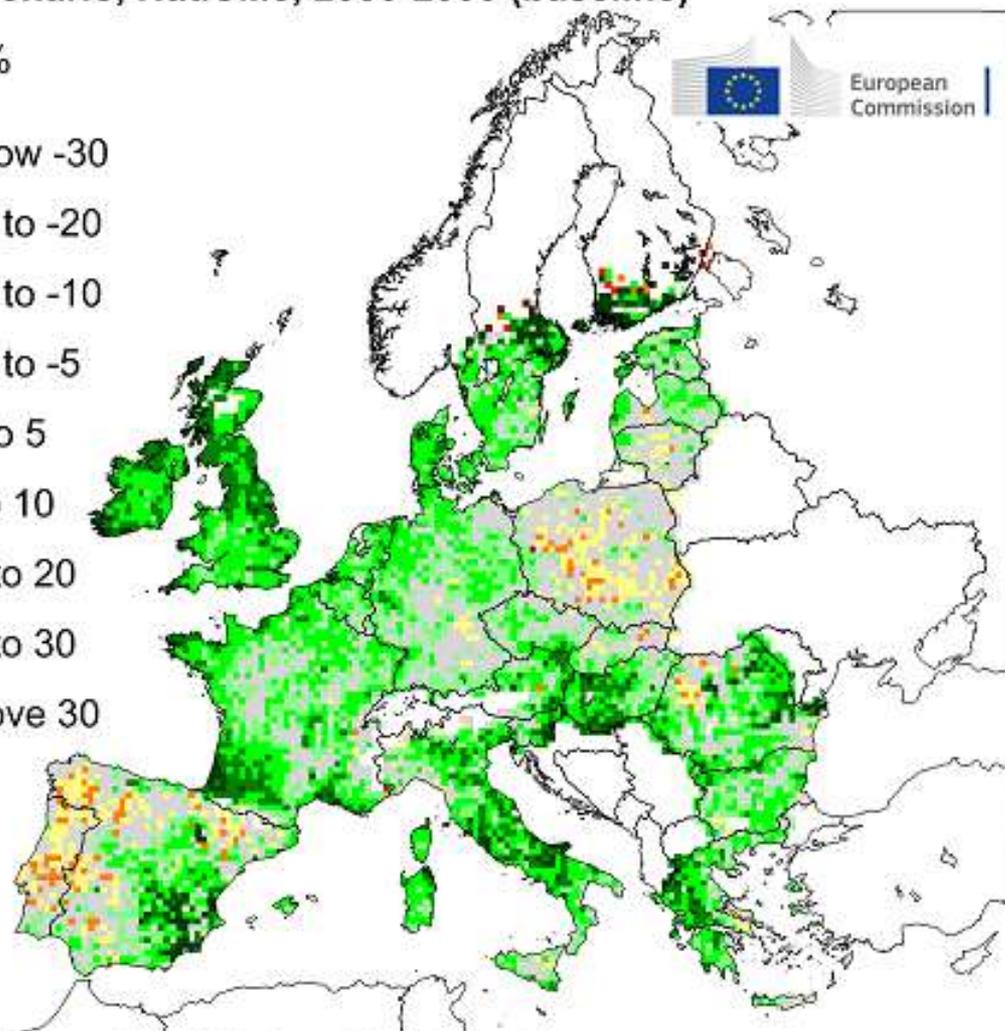

Wheat – best adaptation (%)

Percentage difference of water-limited yield for wheat with adaptation
A1B scenario, HadCM3, 2030-2000 (baseline)

Units: %

- Below -30
- -30 to -20
- -20 to -10
- -10 to -5
- -5 to 5
- 5 to 10
- 10 to 20
- 20 to 30
- Above 30

JRC
Agriculture and Life Sciences in the Economy
July, 2012

Different Aspects...

At **Global** level:

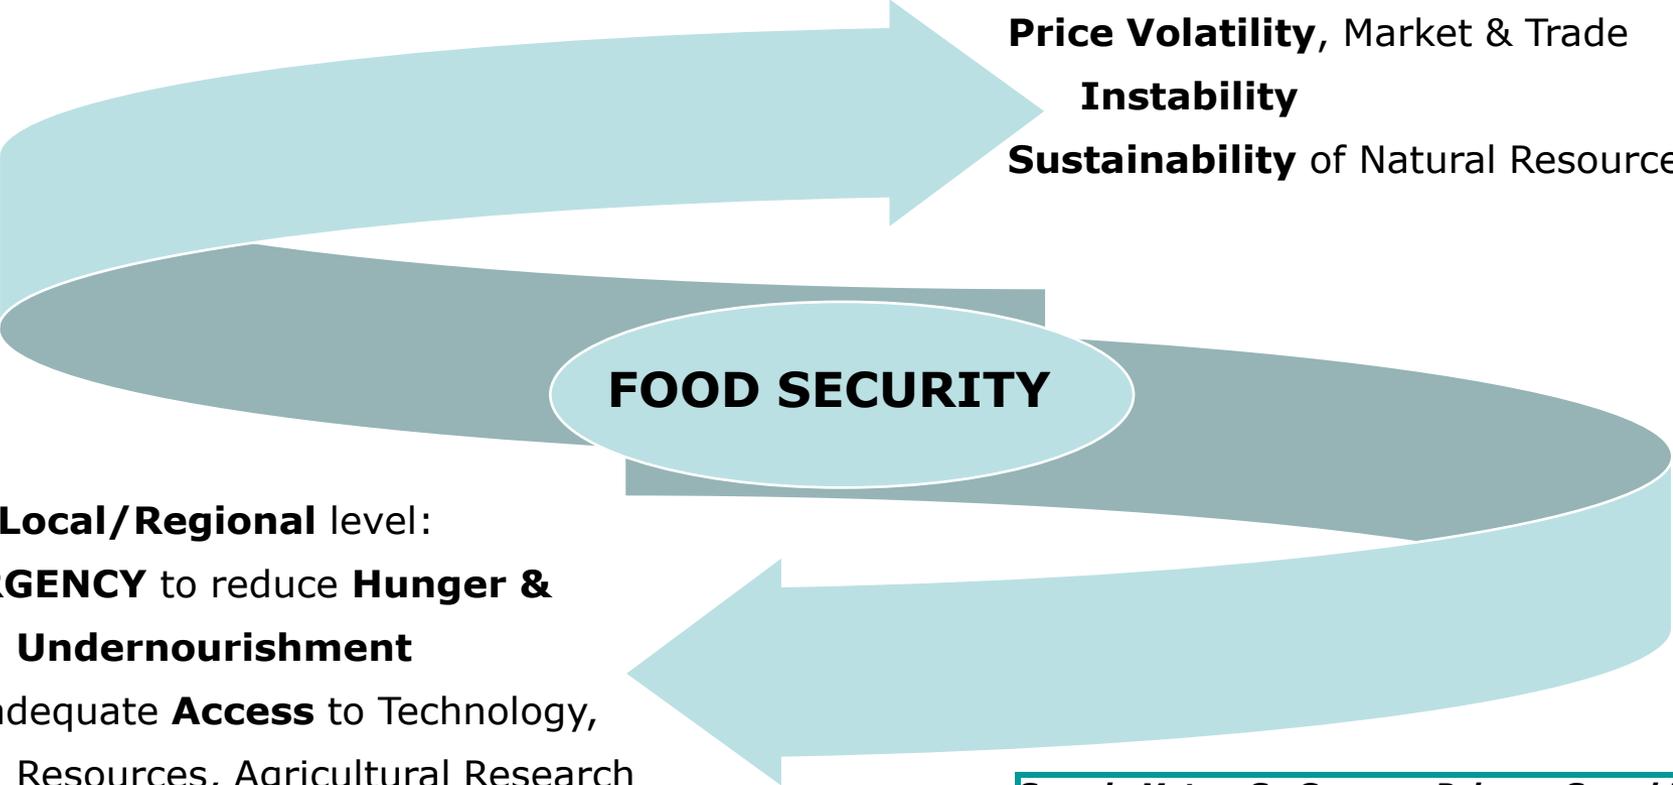

Long Term Food **Availability**

(70% increase towards 2050, FAO, 2009)

Price Volatility, Market & Trade

Instability

Sustainability of Natural Resources

FOOD SECURITY

At **Local/Regional** level:

URGENCY to reduce **Hunger & Undernourishment**

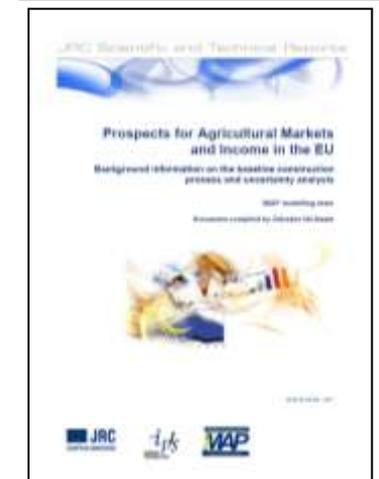

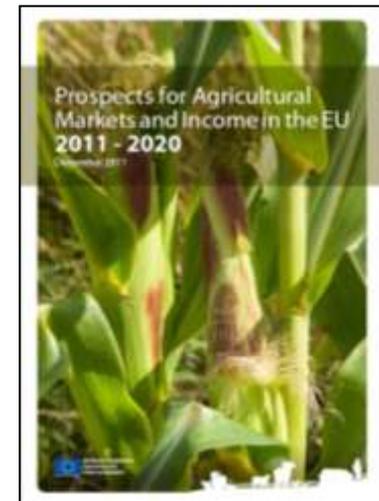

Inadequate **Access** to Technology,
Resources, Agricultural Research

Semi-Subsistence Farming

*Saravia Matus, S., Gomez y Paloma, S. and Mary, S.
(2012) Economics of Food Security: Selected Issues
Bio-Based and Applied Economics*

European outlook 2020: sensitivity of macro-assumptions and production costs

- JRC cooperates with DG AGRI on the annual agricultural market outlook
- Volatility of prices increases uncertainty
- JRC provides sensitivity and stochastic analysis
- Example: Impact of potential input cost developments on EU agriculture
- Identification of most affected regions and most vulnerable production systems
- Scenario analysis against DG AGRI baseline 2020 with the CAPRI model

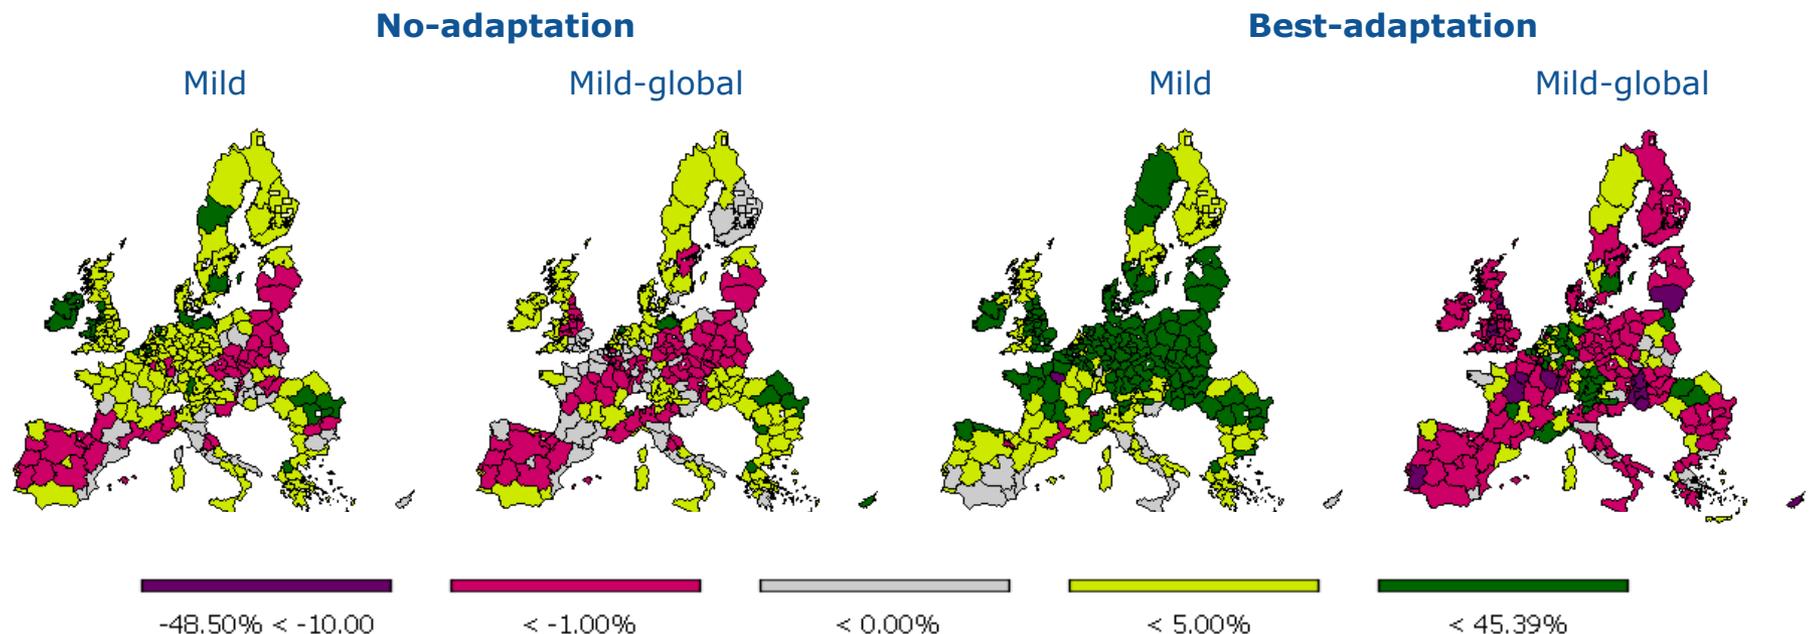

PESETA 2 – agro-economic modelling

- The project investigates the economic impact of climate change on EU agriculture using CAPRI model
- Climate change is reflected through yield changes which are available from BIOMA model (JRC-IES)
- Two climate change scenarios:
 - ‘warm’ scenario (A1B realized in HadCM3 model)
 - ‘mild’ scenario (A1B realized in ECHAM5 model)
- Two adaptation scenarios:
 - ‘no-adaptation’
 - ‘best-adaptation’
- Adaptations considered through BIOMA model; CAPRI takes on small adjustment – technological options
- *Shrestha S. et al. (2012): Regional Impacts of Climate Change on EU Agriculture. IAAE 2012 forthcoming*

Selected results

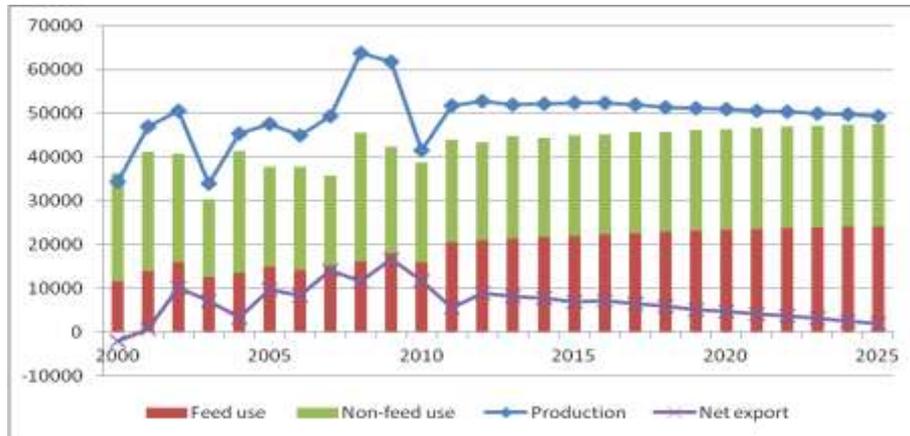

- Yields and production increase due to climate change; there is significant variation at regional level.
- Without price adjustment the agricultural income improves (between 1% and 8%); if price effect is accounted for income slightly declines (between -0.1% and -0.3%).

Income change/ha in EU-27 relative to baseline - % change

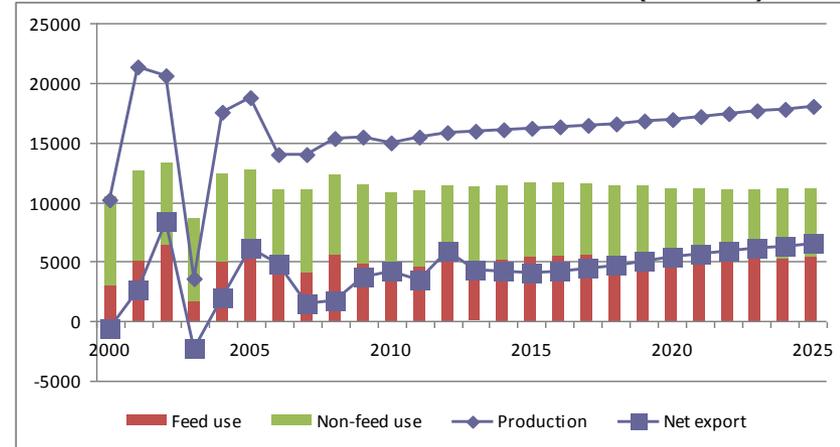

Food supply: Russia & Ukraine markets 2025

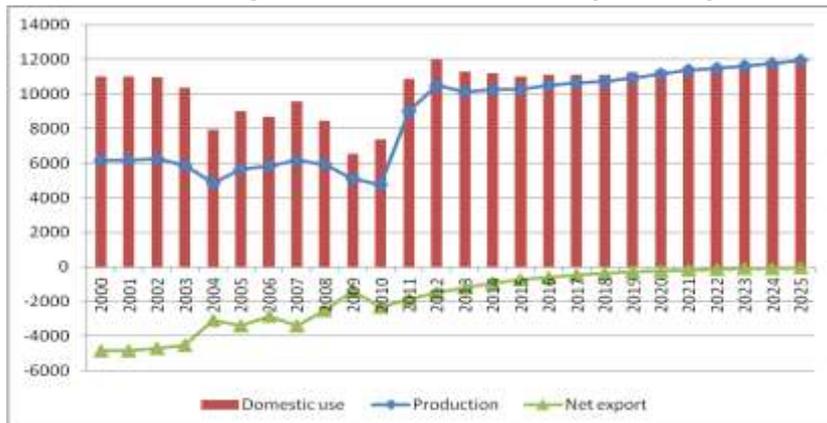

Russia: Soft wheat baseline outlook (1000 t)

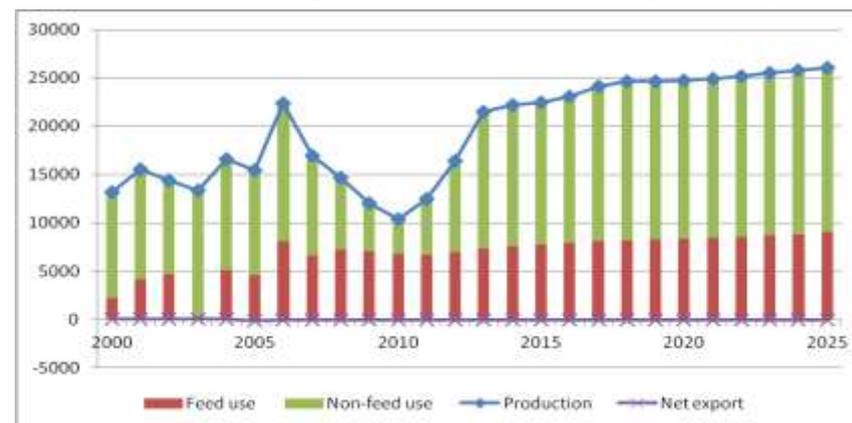

Ukraine: Soft wheat baseline outlook (1000 t)

Russia: Sugar baseline outlook (1000 t)

Ukraine: Sugar baseline outlook (1000 t)

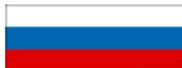

Prospects of the FARMING SECTOR and Rural Development (Food security at the FARM => regional => national/world levels)

Identification and evaluation of challenges & opportunities

- *Farming structure, institutional environment, risks...*
- *Farm support, credit access, transport/storage...*

Russia

Ukraine

➤ Some key preliminary results

- Problematic land consolidation
- Dual structure
- In a context of WTO accession, link between farm policies and profitability
- Lack of financial resources and skilled labour
- Grain storage capacity, rail wagons, logistic problems
- Nontransparent tariffs at inspection points and borders

Prospects of the FARMING SECTOR and Rural Development (2) (Food security at the FARM => regional => national/world levels)

**The current and future capacity of
agriculture to fulfil the domestic demand
for foodstuff and its role in international
markets**

Turkey

Kazakhstan

MAIN ISSUES

Farming systems
Food production, consumption and surpluses
Trade infrastructure
The credit markets and access to credit for farmers and
trade operators
Logistics and infrastructure
Governance and supporting policies
Environmental indicators, CC and risks

Modelling tool for long-term (2050 +) projections and analysis of various scenarios related to food security, climate change, etc.

Key drivers expected to affect situation in 2050+:

- Increasingly binding environmental constraints from natural resources, climate, water, GHG, etc.
- Change of existing consumption patterns due to demographic and socio-economic factors
- Effects of technological change (in production-, distribution-, consumption- systems)
- Performance of key global players, e.g. USA, EU, BRICS, Japan, etc.
- New substitution possibilities generated by high price levels (e.g.: traditional fuel-biofuel)

Long-term modeling: Impact of key drivers

Challenges for economic modeling tools:

- Affect parameters and behavioural specification of the model
- Amend expectations of relative prices, consumption, investments, and savings
- Affect all model endogenous variables (incl. the baseline)

Outlook:

- Feasibility study for a long-term modeling tool with experts from FAO, IIASA, INRA, academia, DG-ECFIN
- Case study: long-term projections (+2050) using innovative modeling approaches
- Close international cooperation with leading research centres working on long-term projections

JRC SCIENTIFIC AND POLICY REPORTS

International workshop on socio-economic impacts of genetically modified crops co-organised by JRC-IPTS and FAO

Workshop proceedings

Maria Lusser, Terri Raney, Pascal Tillie,
Koem Dillen and Emilio Rodríguez Cerezo
2012

Comparative regulatory approaches for new plant breeding techniques

Workshop Proceedings

Maria Lusser and Emilio Rodríguez Cerezo
