STEP **HEALTHY START**

Before cultivation one should secure that the greenhouse environment (air, water, growing substrate) and the starting material are free of pests and diseases. Moreover, preventive products can be applied that prevent crop attackers.

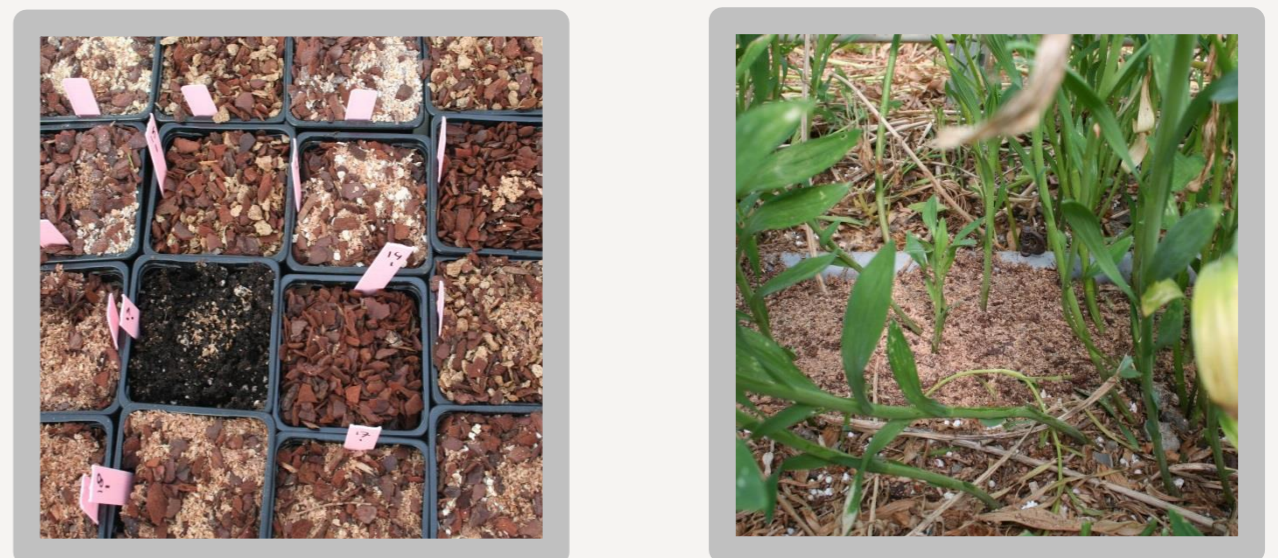

INITIAL CHECK FOR CROP ATTACKERS: THE LUMINEX TEST

Before cultivation the grower can take samples in the greenhouse of the starting material, air, water, growing substrate, etc. and have them analysed. The Luminex test that can be used for this can give a reliable outcome about the presence of crop attackers within a day.

PREVENTIVE SUPPRESSION OF PESTS TOP LAYERS

Thrips can be controlled with predatory mites. This control can be improved by the preventive application of top layers that enable an improved settlement of the predatory mites.

PEST SUPPRESSIVE SUBSTRATE

The preventive application of pest suppressing substrate reduces the occurrence of sciarids with 80%
